Lecture #1 – Maximum Likelihood Estimation Under Mis-specification

Review: the Poisson Distribution

The Kullback-Leibler Divergence

Example: Consistency of Poisson MLE

Asymptotic Theory for MLE Under Mis-specification

The Information Matrix Equality

Example: Asymptotic Variance Calculations for Poisson MLE

“All models are wrong; some are useful.”

Question

What happens if we carry out maximum likelihood estimation, but our model is *wrong*?

This Lecture

Examine a simple example in excruciating detail; present the general theory.

Next Lecture

Apply what we've learned to study **Poisson Regression**, a model for count data.

Suppose that $y \sim \text{Poisson}(\theta)$

Support Set: $\{0, 1, 2, \dots\}$

A Poisson Random Variable is a *count*.

Probability Mass Function

$$f(y|\theta) = \frac{e^{-\theta} \theta^y}{y!}$$

Expected Value: $\mathbb{E}(y) = \theta$

Poisson parameter θ equals the mean of y .

Variance: $\text{Var}(y) = \theta$

You will show this on the problem set.

$$\sum_{y=0}^{\infty} \frac{e^{-\theta} \theta^y}{y!} = e^{-\theta} \sum_{y=0}^{\infty} \frac{\theta^y}{y!} = e^{-\theta} (e^{\theta}) = 1$$

$$\begin{aligned} \mathbb{E}(y) &= \sum_{y=0}^{\infty} y \frac{e^{-\theta} \theta^y}{y!} = \sum_{y=1}^{\infty} y \frac{e^{-\theta} \theta^y}{y!} \\ &= \theta \sum_{y=1}^{\infty} \frac{e^{-\theta} \theta^{y-1}}{(y-1)!} = \theta \sum_{y=0}^{\infty} \frac{e^{-\theta} \theta^y}{y!} = \theta \end{aligned}$$

MLE for θ where $y_1, y_2, \dots, y_N \sim \text{iid Poisson}(\theta)$.

The Likelihood (iid data)

$$L_N(\theta) \equiv \prod_{i=1}^N \frac{e^{-\theta} \theta^{y_i}}{y_i!}$$

The Log-Likelihood

$$\ell_N(\theta) = \sum_{i=1}^N [y_i \log(\theta) - \theta - \log(y_i!)]$$

Maximum Likelihood Estimator

$$\hat{\theta} \equiv \arg \max_{\theta \in \Theta} \ell_N(\theta) = \bar{y}$$

$$\frac{d}{d\theta} \ell_N(\theta) = \sum_{i=1}^N \left[\frac{y_i}{\theta} - 1 \right]$$

$$\frac{d}{d\theta} \ell_N(\hat{\theta}) = 0$$

$$\sum_{i=1}^N \left[y_i / \hat{\theta} - 1 \right] = 0$$

$$\left(\sum_{i=1}^N y_i \right) / \hat{\theta} = N$$

$$\frac{1}{N} \sum_{i=1}^N y_i = \bar{y} = \hat{\theta}$$

The Kullback-Leibler (KL) Divergence

Motivation

How well does a parametric model $f(\mathbf{y}|\boldsymbol{\theta})$ approximate a *true* density/pmf $p_o(\mathbf{y})$?

Definition

$$KL(p_o; f_{\boldsymbol{\theta}}) \equiv \mathbb{E} \left[\log \left\{ \frac{p_o(\mathbf{y})}{f(\mathbf{y}|\boldsymbol{\theta})} \right\} \right]$$

KL Properties

1. *Asymmetric*: $KL(p_o; f_{\boldsymbol{\theta}}) \neq KL(f_{\boldsymbol{\theta}}; p_o)$
2. $KL(p_o; f_{\boldsymbol{\theta}}) \geq 0$; zero iff $p_o = f_{\boldsymbol{\theta}}$
3. Min KL iff max expected log-likelihood

Alternative Expression

$$\mathbb{E} \left[\log \left\{ \frac{p_o(\mathbf{y})}{f(\mathbf{y}|\boldsymbol{\theta})} \right\} \right] = \underbrace{\mathbb{E} [\log p_o(\mathbf{y})]}_{\text{Constant wrt } \boldsymbol{\theta}} - \underbrace{\mathbb{E} [\log f(\mathbf{y}|\boldsymbol{\theta})]}_{\text{Expected Log-like.}}$$

All expectations are wrt p_o

$p_o(\mathbf{y})$ and $f(\mathbf{y}|\boldsymbol{\theta})$ are merely *functions* of the RV \mathbf{y}

$$\mathbb{E}[\log p_o(\mathbf{y})] = \int \log p_o(\mathbf{y}) p_o(\mathbf{y}) d\mathbf{y}$$

$$\mathbb{E}[\log f(\mathbf{y}|\boldsymbol{\theta})] = \int \log f(\mathbf{y}|\boldsymbol{\theta}) p_o(\mathbf{y}) d\mathbf{y}$$

Watch Out!

$KL = \infty$ if $\exists \mathbf{y}$ with $f(\mathbf{y}|\boldsymbol{\theta}) = 0$ & $p_o(\mathbf{y}) \neq 0$

$\text{KL}(p_o; f) \geq 0$ with equality iff $p_o = f$

Jensen's Inequality

If φ is convex then $\varphi(\mathbb{E}[y]) \leq \mathbb{E}[\varphi(y)]$, with equality iff φ is linear or y is constant.

\log is concave so $(-\log)$ is convex

$$\begin{aligned}\mathbb{E} \left[\log \left\{ \frac{p_o(y)}{f(y)} \right\} \right] &= \mathbb{E} \left[-\log \left\{ \frac{f(y)}{p_o(y)} \right\} \right] \geq -\log \left\{ \mathbb{E} \left[\frac{f(y)}{p_o(y)} \right] \right\} \\ &= -\log \left\{ \int_{-\infty}^{\infty} \frac{f(y)}{p_o(y)} \cdot p_o(y) dy \right\} \\ &= -\log \left\{ \int_{-\infty}^{\infty} f(y) dy \right\} \\ &= -\log(1) = 0\end{aligned}$$

A Simple Example: Calculating the KL Divergence

Remember: all expectations are calculated using p_o .

True Distribution p_o

$y_1, \dots, y_N \sim \text{iid } p_o$ where:

$$p_o(0) = \frac{2}{5}, p_o(1) = \frac{1}{5}, p_o(2) = \frac{2}{5}.$$

Mis-specified Model f_θ

$y_1, \dots, y_N \sim \text{iid Poisson}(\theta)$

KL Divergence

$$KL(p_o; f_\theta) = \theta - \log \theta + (\text{Constant})$$

$$KL(p_o; f_\theta) = \mathbb{E}[\log p_o(y)] - \mathbb{E}[\log f(y|\theta)]$$

$$\begin{aligned}\mathbb{E}[\log p_o(y)] &= \sum_{\text{all } y} \log [p_o(y)] p_o(y) \\ &= \log \left(\frac{2}{5} \right) \times \frac{2}{5} + \log \left(\frac{1}{5} \right) \times \frac{1}{5} + \log \left(\frac{2}{5} \right) \times \frac{2}{5}\end{aligned}$$

$$\begin{aligned}\mathbb{E}[\log f(y|\theta)] &= \sum_{\text{all } y} \log \left[\frac{e^{-\theta} \theta^y}{y!} \right] p_o(y) \\ &= \log \left(e^{-\theta} \right) \times \frac{2}{5} + \log \left(e^{-\theta} \theta \right) \times \frac{1}{5} + \log \left(\frac{e^{-\theta} \theta^2}{2} \right) \times \frac{2}{5} \\ &= - \left[\theta - \log(\theta) + \log(2) \times \frac{2}{5} \right]\end{aligned}$$

A Simple Example Continued: Minimizing the KL Divergence

Model = Poisson(θ); True Dist. $p_o(0) = p_o(2) = \frac{2}{5}$ and $p_o(1) = \frac{1}{5}$

Best Approximation

What parameter value θ_o makes the Poisson(θ) model *as close as possible* to the true distribution p_o , where we measure “closeness” using the KL-divergence?

Using the previous slide

$$KL(p_o; f_\theta) = \theta - \log \theta + (\text{Const.})$$

$$\text{FOC: } 0 = 1 - \frac{1}{\theta} \implies \boxed{\theta = 1}$$

A more direct approach

Min KL \iff Max Expected Log-like.

$$\begin{aligned} \frac{d}{d\theta} \mathbb{E}[\log f(y|\theta)] &= \mathbb{E} \left[\frac{d}{d\theta} \{-\theta + y \log(\theta) - \log(y!)\} \right] \\ &= \mathbb{E}[-1 + y/\theta] = \mathbb{E}[y]/\theta - 1 = 0 \\ &\implies \boxed{\theta = \mathbb{E}[y]} \end{aligned}$$

A Simple Example Continued: Minimizing the KL Divergence

Model = Poisson(θ); True Dist. $p_o(0) = p_o(2) = \frac{2}{5}$ and $p_o(1) = \frac{1}{5}$

Best Approximation

What parameter value θ_o makes the Poisson(θ) model *as close as possible* to the true distribution p_o , where we measure “closeness” using the KL-divergence?

Using the previous slide: $\theta_o = 1$

A more direct approach: $\theta_o = \mathbb{E}[y]$

Both Methods Agree

- ▶ For the specified p_o we have: $\mathbb{E}[y] = 0 \times \frac{1}{5} + 1 \times \frac{2}{5} + 2 \times \frac{2}{5} = 1$.
- ▶ The “Direct approach” is general: works for *any* p_o (under regularity conditions)

Is this just a coincidence?

We have shown that:

1. Under an iid $\text{Poisson}(\theta)$ model for y_1, \dots, y_N , the MLE for θ is $\hat{\theta} = \bar{y}$
2. For *any* (reasonable) p_o , setting $\theta_o = \mathbb{E}[y_i]$ minimizes $KL(p_o; f_\theta)$.

By the (weak) law of large numbers:

If $y_1, \dots, y_N \sim \text{iid}$, then \bar{y} is a consistent estimator of $\mathbb{E}[y_i]$ as N approaches infinity.

So at least in this example...

The maximum likelihood estimator $\hat{\theta}$ is a consistent estimator of θ_o , the minimizer the KL divergence from the true distribution p_o to the $\text{Poisson}(\theta)$ model $f(y|\theta)$.

Maximum Likelihood Estimation Under Mis-specification

Note: expectations and variances are calculated using p_o

Theorem

Suppose that $\mathbf{y}_1, \dots, \mathbf{y}_N \sim \text{iid } p_o$ and let $\hat{\boldsymbol{\theta}}$ denote the MLE for $\boldsymbol{\theta}$ under the possibly mis-specified model $f(\mathbf{y}|\boldsymbol{\theta})$. Then, under mild regularity conditions:

(i) $\hat{\boldsymbol{\theta}}$ is consistent for the **pseudo-true** parameter value $\boldsymbol{\theta}_o$, defined as the minimizer of $KL(p_o, f_{\boldsymbol{\theta}})$ over the parameter space Θ .

(ii) $\sqrt{N}(\hat{\boldsymbol{\theta}} - \boldsymbol{\theta}_o) \rightarrow_d \mathcal{N}(\mathbf{0}, \mathbf{J}^{-1}\mathbf{K}\mathbf{J}^{-1})$

where we define $\mathbf{J} \equiv -\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right]$ and $\mathbf{K} \equiv \text{Var} \left[\frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right]$.

Why is this result such a big deal?

1. Provides an interpretation of MLE when we acknowledge that our models are only an *approximation* or reality: MLE recovers the pseudo-true parameter θ_o .
2. Yields a formula for standard errors that is **robust** to mis-specification of our model: compare to Heteroskedasticity consistent SEs for regression.
3. If the model is correctly specified, we recover the “classical” MLE result.

A Consistent Asymptotic Variance Matrix Estimator: $\hat{\mathbf{J}}^{-1}\hat{\mathbf{K}}\hat{\mathbf{J}}^{-1}$

$\hat{\boldsymbol{\theta}} \rightarrow_p \boldsymbol{\theta}_o$ plus Uniform Weak Law of Large Numbers: Newey & McFadden (1994)

$$\boldsymbol{\theta}_o \equiv \arg \max_{\boldsymbol{\theta} \in \Theta} \mathbb{E} [\log f(\mathbf{y}_i | \boldsymbol{\theta})] \quad \hat{\boldsymbol{\theta}} \equiv \arg \max_{\boldsymbol{\theta} \in \Theta} \frac{1}{N} \sum_{i=1}^N \log f(\mathbf{y}_i | \boldsymbol{\theta})$$

$$\sqrt{N}(\hat{\boldsymbol{\theta}} - \boldsymbol{\theta}_o) \rightarrow_d \mathcal{N}(\mathbf{0}, \mathbf{J}^{-1}\mathbf{K}\mathbf{J}^{-1}) \quad \hat{\boldsymbol{\theta}} \approx \mathcal{N}(\boldsymbol{\theta}_o, \hat{\mathbf{J}}^{-1}\hat{\mathbf{K}}\hat{\mathbf{J}}^{-1}/N)$$

$$\mathbf{J} \equiv -\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}_i | \boldsymbol{\theta}_o)}{\partial^2 \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right] \quad \hat{\mathbf{J}} \equiv -\frac{1}{N} \sum_{i=1}^N \frac{\partial^2 \log f(\mathbf{y}_i | \hat{\boldsymbol{\theta}})}{\partial^2 \boldsymbol{\theta} \partial \boldsymbol{\theta}'}$$

$$\mathbf{K} \equiv \text{Var} \left[\frac{\partial \log f(\mathbf{y}_i | \boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right] \quad \hat{\mathbf{K}} \equiv \frac{1}{N} \sum_{i=1}^N \left[\frac{\partial \log f(\mathbf{y}_i | \hat{\boldsymbol{\theta}})}{\partial \boldsymbol{\theta}} \right] \left[\frac{\partial \log f(\mathbf{y}_i | \hat{\boldsymbol{\theta}})}{\partial \boldsymbol{\theta}} \right]'$$

Some Notes on the Preceding Slide

What happened to the KL divergence?

$\mathbb{E}[\log p_o(\mathbf{y})]$ does not involve θ . Hence, $\arg \max_{\theta \in \Theta} \mathbb{E}[\log f(\mathbf{y}_i|\theta)] = \arg \min_{\theta \in \Theta} KL(p_o, f_\theta)$.

Isn't $\hat{\mathbf{K}}$ missing a term?

The sample variance of \mathbf{x} is given by $\left(\frac{1}{N} \sum_{i=1}^N \mathbf{x}_i \mathbf{x}_i'\right) - (\bar{\mathbf{x}} \bar{\mathbf{x}}')$ where $\bar{\mathbf{x}} = \frac{1}{N} \sum_{i=1}^N \mathbf{x}_i$. In our formula for $\hat{\mathbf{K}}$, the “ $\bar{\mathbf{x}} \bar{\mathbf{x}}'$ ” term appears to be missing, but it is in fact equal to zero, since $\hat{\theta}$ is the solution to the MLE first-order condition.

Some Terminology

I will call $\hat{\mathbf{J}}^{-1} \hat{\mathbf{K}} \hat{\mathbf{J}}^{-1}$ the **robust** asymptotic variance matrix estimator, since it is correct regardless of whether the model is correctly specified.

Maximum Likelihood Estimation Under Correct Specification

“Classical” large-sample theory for MLE

Theorem

Suppose that $\mathbf{y}_1, \dots, \mathbf{y}_N \sim \text{iid } f(\mathbf{y}|\boldsymbol{\theta}_o)$. Then, under mild regularity conditions:

(i) $\boldsymbol{\theta}_o$ is consistent for $\boldsymbol{\theta}_o$.

(ii) $\sqrt{N}(\hat{\boldsymbol{\theta}} - \boldsymbol{\theta}_o) \rightarrow_d \mathcal{N}(\mathbf{0}, \mathbf{J}^{-1})$ where $\mathbf{J} \equiv -\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial^2 \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right]$.

Why? If $p_o(\mathbf{y}) = f(\mathbf{y}|\boldsymbol{\theta}_o)$, then:

1. $KL(p_o; f_{\boldsymbol{\theta}})$ equals zero at $\boldsymbol{\theta} = \boldsymbol{\theta}_o$.
2. The *information matrix equality* gives $\mathbf{K} = \mathbf{J}$ which implies $\mathbf{J}^{-1}\mathbf{K}\mathbf{J}^{-1} = \mathbf{J}^{-1}$.

The Information Matrix Equality: if $p_o(\mathbf{y}) = f(\mathbf{y}|\boldsymbol{\theta}_o)$, then $\mathbf{K} = \mathbf{J}$.

$$\mathbf{J} \equiv -\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial^2 \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right], \quad \mathbf{K} \equiv \text{Var} \left[\frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right]$$

Step 1: Alternative Expression for \mathbf{K}

$$\text{Var} \left[\frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right] = \mathbb{E} \left[\left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\} \left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\}' \right] - \mathbb{E} \left[\frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right] \mathbb{E} \left[\frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right]'$$

but since $\boldsymbol{\theta}_o$ minimizes $\mathbb{E} [\log f(\mathbf{y}|\boldsymbol{\theta})]$,

$$\mathbb{E} \left[\frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right] = \frac{\partial}{\partial \boldsymbol{\theta}} \mathbb{E} [\log f(\mathbf{y}|\boldsymbol{\theta}_o)] = \mathbf{0}$$

so it suffices to show that

$$-\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial^2 \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right] = \mathbb{E} \left[\left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\} \left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\}' \right]$$

The Information Matrix Equality: if $p_o(\mathbf{y}) = f(\mathbf{y}|\boldsymbol{\theta}_o)$, then $\mathbf{K} = \mathbf{J}$.

$$\text{suffices to show } -\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right] = \mathbb{E} \left[\left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\} \left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\}' \right]$$

Step 2: Chain Rule & Product Rule

$$\begin{aligned} \frac{\partial^2}{\partial \theta_i \partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}) &= \frac{\partial}{\partial \theta_i} \left[\frac{\partial}{\partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}) \right] = \frac{\partial}{\partial \theta_i} \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial}{\partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}) \right] \\ &= \left[-\frac{1}{f^2(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial}{\partial \theta_i} f(\mathbf{y}|\boldsymbol{\theta}) \right] \left[\frac{\partial}{\partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}) \right] + \frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}) \\ &= - \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial}{\partial \theta_i} f(\mathbf{y}|\boldsymbol{\theta}) \right] \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial}{\partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}) \right] + \frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}) \\ &= -\frac{\partial}{\partial \theta_i} \log f(\mathbf{y}|\boldsymbol{\theta}) \frac{\partial}{\partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}) + \frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}) \end{aligned}$$

The Information Matrix Equality: if $p_o(\mathbf{y}) = f(\mathbf{y}|\boldsymbol{\theta}_o)$, then $\mathbf{K} = \mathbf{J}$.

$$\text{suffices to show } -\mathbb{E} \left[\frac{\partial^2 \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta} \partial \boldsymbol{\theta}'} \right] = \mathbb{E} \left[\left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\} \left\{ \frac{\partial \log f(\mathbf{y}|\boldsymbol{\theta}_o)}{\partial \boldsymbol{\theta}} \right\}' \right]$$

Step 3: Multiply by -1 , Evaluate at $\boldsymbol{\theta}_o$, and Take Expectations

$$\frac{\partial^2}{\partial \theta_i \partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}) = -\frac{\partial}{\partial \theta_i} \log f(\mathbf{y}|\boldsymbol{\theta}) \frac{\partial}{\partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}) + \frac{1}{f(\mathbf{y}|\boldsymbol{\theta})} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta})$$

$$-\mathbb{E} \left[\frac{\partial^2}{\partial \theta_i \partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}_o) \right] = \mathbb{E} \left[\frac{\partial}{\partial \theta_i} \log f(\mathbf{y}|\boldsymbol{\theta}_o) \frac{\partial}{\partial \theta_j} \log f(\mathbf{y}|\boldsymbol{\theta}_o) \right] - \underbrace{\mathbb{E} \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta}_o)} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}_o) \right]}_{\text{suffices to show this is zero!}}$$

The Information Matrix Equality: if $p_o(\mathbf{y}) = f(\mathbf{y}|\boldsymbol{\theta}_o)$, then $\mathbf{K} = \mathbf{J}$.

$$\text{suffices to show } \mathbb{E} \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta}_o)} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}_o) \right] = 0$$

Step 4: Use $p_o(\mathbf{y}) = f(\mathbf{y}|\boldsymbol{\theta}_o)$

$$\begin{aligned} \mathbb{E} \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta}_o)} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}_o) \right] &\equiv \int \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta}_o)} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}_o) \right] p_o(\mathbf{y}) d\mathbf{y} \\ &= \int \left[\frac{1}{f(\mathbf{y}|\boldsymbol{\theta}_o)} \cdot \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}_o) \right] f(\mathbf{y}|\boldsymbol{\theta}_o) d\mathbf{y} = \int \frac{\partial^2}{\partial \theta_i \partial \theta_j} f(\mathbf{y}|\boldsymbol{\theta}_o) d\mathbf{y} \\ &= \frac{\partial^2}{\partial \theta_i \partial \theta_j} \int f(\mathbf{y}|\boldsymbol{\theta}_o) d\mathbf{y} = \frac{\partial^2}{\partial \theta_i \partial \theta_j} (1) = 0 \end{aligned}$$

A Simple Example Continued Again: Asymptotic Variance Calculations

Poisson(θ) model, possibly mis-specified.

Ingredients

$$\begin{aligned}\log f(y|\theta) &= -\theta + y \log(\theta) - \log(y!) \\ \frac{d}{d\theta} \log f(y|\theta) &= -1 + y/\theta \\ \frac{d^2}{d\theta^2} \log f(y|\theta) &= -y/\theta^2 \\ \theta_o &= \mathbb{E}[y], \quad \hat{\theta} = \bar{y}\end{aligned}$$

$$J = -\mathbb{E} \left[\frac{d^2}{d\theta^2} \log f(y|\theta_o) \right] = 1/\mathbb{E}[y]$$

$$\hat{J} = -\frac{1}{N} \sum_{i=1}^N \frac{d^2}{d\theta^2} \log f(y_i|\hat{\theta}) = 1/\bar{y}$$

$$K = \text{Var} \left[\frac{d}{d\theta} \log f(y|\theta_o) \right] = \text{Var}(y)/\mathbb{E}[y]^2$$

$$\hat{K} = \frac{1}{N} \sum_{i=1}^N \left[\frac{d}{d\theta} \log f(y_i|\hat{\theta}) \right]^2 = s_y^2/(\bar{y})^2$$

where $s_y^2 \equiv \frac{1}{N} \sum_{i=1}^N (y_i - \bar{y})^2$ and $\bar{y} \equiv \frac{1}{N} \sum_{i=1}^N y_i$

A Simple Example Continued Again: Asymptotic Variance Calculations

From Previous Slide

$$\theta_0 = \mathbb{E}[y], \quad J = 1/\mathbb{E}[y], \quad \hat{J} = 1/\bar{y}, \quad K = \text{Var}(y)/\mathbb{E}[y]^2, \quad \hat{K} = s_y^2/(\bar{y})^2$$

Correct Specification

$$\boxed{y_1, \dots, y_N \sim \text{iid Poisson}(\theta_o)} \implies \boxed{J = K = 1/\theta_o} \implies \boxed{J^{-1} K J^{-1} = \theta_o = \mathbb{E}[y]}$$

Potential Mis-specification

$$\boxed{y_1, \dots, y_N \sim \text{iid}} \implies \boxed{J = 1/\mathbb{E}[y], \quad K = \text{Var}(y)/\mathbb{E}[y]^2} \implies \boxed{J^{-1} K J^{-1} = \text{Var}(y)}$$

A Simple Example Continued Again: Asymptotic Variance Calculations

Comparison of Asymptotic Distributions

$$\boxed{y_1, \dots, y_N \sim \text{iid Poisson}(\theta_o)} \implies \sqrt{N}(\hat{\theta} - \theta_o) = \sqrt{N}(\bar{y} - \mathbb{E}[y]) \rightarrow_d \mathcal{N}(0, \mathbb{E}[y])$$

$$\boxed{y_1, \dots, y_N \sim \text{iid}} \implies \sqrt{N}(\hat{\theta} - \theta_o) = \sqrt{N}(\bar{y} - \mathbb{E}[y]) \rightarrow_d \mathcal{N}(0, \text{Var}[y])$$

Comparison of Asymptotic 95% CIs

$$\boxed{y_1, \dots, y_N \sim \text{iid Poisson}(\theta_o)} \implies \bar{y} \pm 1.96 \times \sqrt{\bar{y}/N}$$

$$\boxed{y_1, \dots, y_N \sim \text{iid}} \implies \bar{y} \pm 1.96 \times s_y / \sqrt{N}$$

Punch Line

Unless $\text{Var}(y) = \mathbb{E}[y]$, CIs/tests that assume the Poisson model is true are wrong!
